English footing and flapping

**Fresno State Linguistics
Department Colloquium**

Darin Flynn
School of Languages, Linguistics, Literatures and Cultures
Faculty of Arts, University of Calgary

January 25th, 2024

Background issue: to recur or not to recur

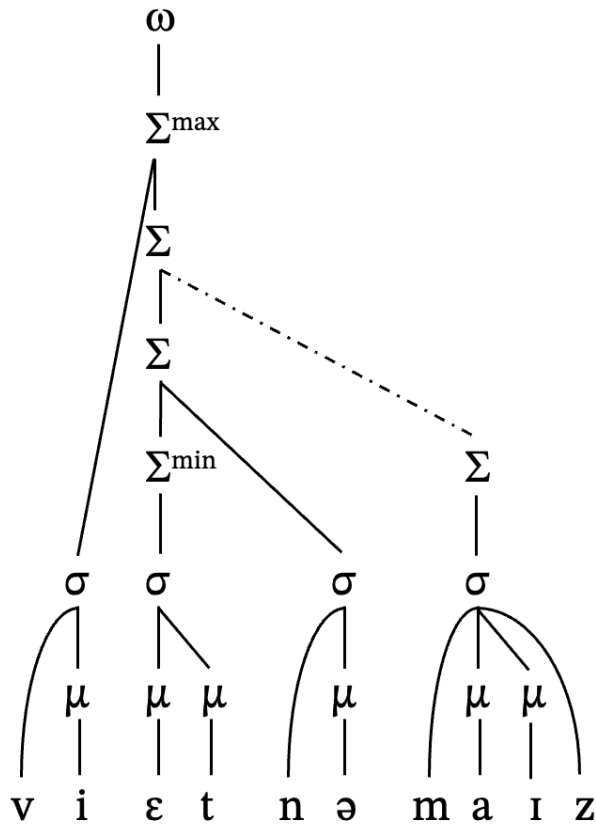

“prosodic constituents of a same category are not nested”
(Selkirk 1986:384; see also Nespor & Vogel 1986, 2007;
Vogel 2009)

“Recursion consists of embedding a constituent in a constituent of the same type, for example a relative clause inside a relative clause... This does not exist in phonological structure.”
(Pinker & Jackendoff 2005:211)

“The rules that construct the phonological hierarchy are not recursive in nature, while the rules that construct the syntactic hierarchy are.” (Nespor & Vogel 2007:2)

Lots of Σ -recursion in practice, e.g.,
“the stem-level phonology of English achieves
exhaustive footing by means of adjunction”
(Bermúdez-Otero 2018b:127)

cf.

Vietnamize

Σ -recursion is simple enough when it's one-sided (Bermúdez-Otero 2018b)

periodable

**Σ -recursion is less determined when it's two-sided
(see also Ito & Mester 2009b; Kabak & Revithiadou 2009;
Vogel 2012; Golston 2021; etc.)**

or

or

remediable

Σ -recursion has long been used for exceptional medial aspiration (Withgott 1982) and for exceptions to Withgott's Paradox (lots by Jensen, Davis, and Bermúdez-Otero)

militaristic

capitalistic

**Σ-recursion is also
invoked for prosodic
morphology
(Davis 2005; cf.
McCarthy 1982b)**

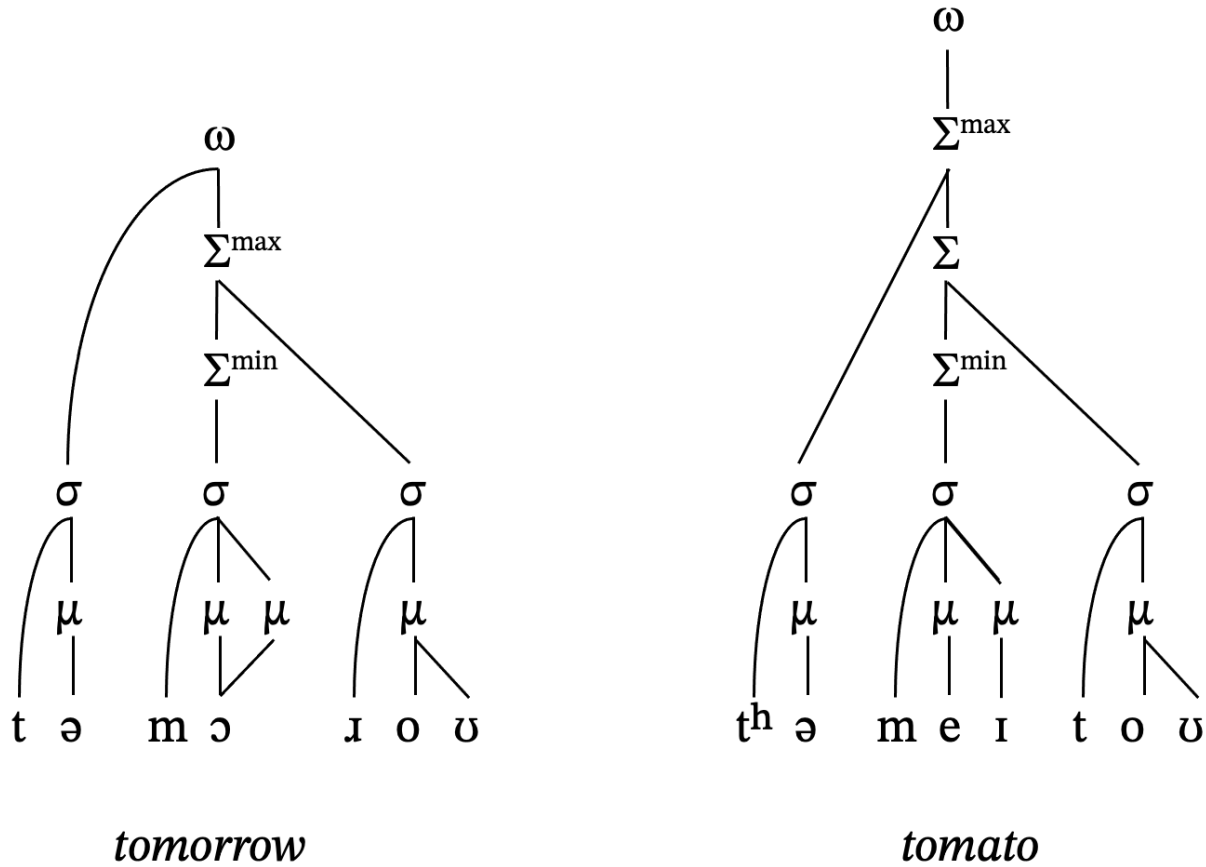

Lollapalooza → *Lolla-fuckin'-palooza*; *Lesbopalooza*; etc.

“... the strict layering doctrine is ... confronted with the ... problem: “Too much structure”. In order to fulfill strict layering, representations have to be padded to fill every layer, leading to the positing of categories emptied of their intrinsic meaning. ... — a [Japanese] form like *anime* is structured as $[\omega ({}_f \check{\sigma}\check{\sigma}) \check{\sigma}]$, with an unfooted last syllable directly dominated by ω , not as $[\omega ({}_f \check{\sigma}\check{\sigma}) ({}_f \check{\sigma})]$, with a degenerate second foot “f”, or as $[\omega ({}_F ({}_f \check{\sigma}\check{\sigma}) \check{\sigma})]$, with a superordinate “superfoot” F.” (Ito & Mester 2009:147)

Exception that proves the exhaustive footing rule?

(cf. Ito & Mester 2009b; Goldsmith 2011)

Using ω recursion instead (Ito & Mester 2009b)

The Phonology of Compounds

Irene Vogel

<https://doi.org/10.1093/acrefore/9780199384655.013.615>

Published online: 28 June 2021

Summary

A number of recent developments in phonological theory, beginning with *The Sound Pattern of English*, are particularly relevant to the phonology of compounds. They address both the phonological phenomena that apply to compound words and the phonological structures that are required as the domains of these phenomena: segmental and nonsegmental phenomena that operate within each member of a compound separately, as well as at the juncture between the members of compounds and throughout compounds as a whole. In all cases, what is crucial for the operation of the phonological phenomena of compounds is phonological structure, in terms of constituents of the Prosodic Hierarchy, as opposed to morphosyntactic structure. Specifically, only two phonological constituents are required, the Phonological Word, which provides the domain for phenomena that apply to the individual members of compounds and at their junctures, and a larger constituent that groups the members of compounds together. The nature of the latter is somewhat controversial, the main issue being whether or not there is a constituent in the Prosodic Hierarchy between the Phonological Word and the Phonological Phrase. When present, this constituent, the Composite Group (revised from the original Clitic Group), includes the members of compounds, as well as “stray” elements such as clitics and “Level 2” affixes. In its absence,

“There is a clear difference in phrasing between such word+enclitic collocations and stem+level II suffix combinations... *visit it* and *draw it* are extended prosodic word structures, whereas *visited* and *drawing* are prosodified as single (nonextended) prosodic words” (Ito & Mester 2009b:252)

See also Sherer (1994), Raffelsiefen (2005), Bermúdez-Otero (2011), etc.

draw it

relationshiplessness

Hayes, Bruce. 2000. Gradient well-formedness in Optimality Theory. In Joost Dekkers, Frank van der Leeuw & Jeroen van de Weijer (eds.), *Optimality Theory: phonology, syntax and acquisition*, 88–120. Oxford, U.K.: Oxford University Press

(20) Word set	Average difference score	Significance
a. <i>light, Louanne</i>	4.62	p < .0001
b. <i>gray-ling, gai-ly, free-ly</i>	1.78	
c. <i>Mailer, Hayley, Greeley, Daley</i>	0.74	p = .0527
d. <i>mail-er, hail-y, gale-y, feel-y</i>	-0.97	p = .0006
e. <i>mail it</i>	-3.30	p = .0031
f. <i>mail, help</i>	-5.47	p = .0021

It can be seen that all the results but one are highly significant statistically, and that the remaining one is near-significant. Keeping the near-significant outcome as a case on which further checking should be done, I will assume for present purposes that all differences given here should be accounted for in an adequate analysis.¹¹

Nuthin' but a 'G' Thang

long-er

sing-er

sing (h)er "X"

sing "Eraser"

Superheavy-final stems are now possible ω -internally, e.g.

traipsing it

coaxes it

(The s's are probably resyllabified as onsets. Resyllabification is definitely blocked at the left edge of ψ and ω , but uncertain about the right edge of ψ .)

**‘Monongahela’ reanalyzed as a *pseudocompound*
which I define as a ω with more than one ψ**

Monongahela

Withgott effect reanalyzed with *pseudocompounds*

militaristic

capitalistic

This is a better solution because the first ψ is no longer expected to show ω -final boundary lengthening effect (cf. Sproat 1993 above)

[Thanks to Ricardo Bermúdez-Otero for valuable discussion on this point]

militaristic

capitalistic

Pseudocompound solution for prosodic-morphological patterns, too

Lollapalooza

Lolla-fuckin'-palooza

(expletive is prefixed to the prosodic stem)

Lollapa-fuckin'-looza

(expletive is prefixed to the pitch-accented foot)

Again, this is a better solution because the first ψ is no longer expected to show ω -final boundary lengthening effect (cf. Sproat 1993 above)

Lollapalooza

Lolla-fuckin'-palooza

(expletive is prefixed to the prosodic stem)

Lollapa-fuckin'-looza

(expletive is prefixed to the pitch-accented foot)

Proposal: English systematically creates pseudocompounds to avoid stem-medial stress lapses

Withgott's paradox disappears if words with medial lapses are in fact phonological pseudocompounds:

[[**M***ä***n**i]_ψ[*to***w**oc]_ψ]_ω

cf. [[*ä***pp**le]_ω[**ca**ke]_ω]_κ

[[**N***ä***v**ra]_ψ[*til***ö**va]_ψ]_ω

cf. [[*ä***pp**le]_ω[**pie**]_ω]_κ

I suggest that long words are broken up in this way to avoid ψ-internal stress lapses: *[**M***ä***n**i**w**oc]_ψ, *[**N***ä***v**r**ä****t***il***ö**va]_ψ

*LAPSE (Elenbaas 1999; Kager 2003; Gordon 2002:502; Alber 2005:500; cf. Selkirk's 1984 'Anti-Lapse Filter')

English phonology is much more tolerant of adjacent unstressed syllables across stems (Selkirk 1996:195)

*LAPSE/ ψ >> *LAPSE/ ω , MATCH-WORD

“Assign one violation for every lexical word in the syntactic component that does not stand in a correspondence relation with a prosodic word in the phonological component”

(Elfner 2012, p. 241; see also Weir 2012, p. 111; Bennett et al. 2015, p. 34)

Pseudocompounding may represent an Anglo-Saxon style nativizing process

“English has basically two types of word — the familiar homely sounding and typically very short words ... and the more learned, foreign-sounding and characteristically rather long words” (Quirk 1974, p. 138)

Highlight: Heretofore intractable *Luxipalilla* problem

(Pater 2000:269; Collie 2007:319–326)

Why can't heavy-initial words like *Luxipalilla*, *Hardecanute*, *Hōnokaōpe*, etc. be footed *[(*Lùx*)(*ìpa*)(*lilla*)], *[(*Hàr*)(*dèca*)(*núte*)], etc.?

Perhaps because a lapse-breaking internal ψ -boundary intervenes in such cases: [[*Lùxi*] $_{\psi}$][*palilla*] $_{\psi}$] $_{\omega}$, [[*Hàrde*] $_{\psi}$][*canúte*] $_{\psi}$] $_{\omega}$

Observe the ψ -initial allophony here, too: ...[p^h]*alilla*, ...[k^h]*anúte*

Envoi: If English systematically creates pseudocompounds to avoid stem-medial stress lapses, does it do the same to avoid stem-medial stress clashes?

Northern (Canadian) Raising (Bermudez-Otero 2019) and Southern Raising (Moreton 2016) may be blocked by stem boundaries as well as in stress clash contexts, e.g.,

titanic ‘titan-like’, but more often ‘awesome, enormous’
citation ‘act of citing’, but more often ‘quotation/commendation/
summons’

Very tentative proposal: the stress clash is removed by pseudocompounding but this may be blocked if the to-be-split stem is too transparent:

“cyclic overapplication [of Southern Raising] cases

typology ‘study of types’ also ‘study of crosslinguistic variation’
Hittitology ‘study of Hittite’” (Bermudez-Otero 2019:9)

Canadian English (Barber 2004)

ty·phoid /'təɪfɔɪd/ ● *noun* **1** (in full **typhoid fever**) a severe infectious fever caused by the bacterium *Salmonella typhi*, involving a rash, myalgia, and in some cases delirium and intestinal inflammation. **2** a similar disease of animals ● *adjective* resembling or characteristic of typhus. □ **ty·phoid·al** /,təɪ'fɔɪdəl/ *adjective* [TYPHUS + -OID]

Typhoid Mary *noun* **1** a person who transmits a disease widely without showing its symptoms. **2** a transmitter of undesirable opinions, sentiments, etc. [nickname of Mary Mallon, Irish-born cook who transmitted typhoid fever in the US, d.1938]

Ty·phon /'təɪfən/ *Gk Myth* a monster with 100 serpent heads, who was cast by Zeus into Tartarus, and who was held to be the source of winds which cause shipwreck and devastation.

ty·phoon /tai'fu:n/ *noun* a violent storm occurring in or around the

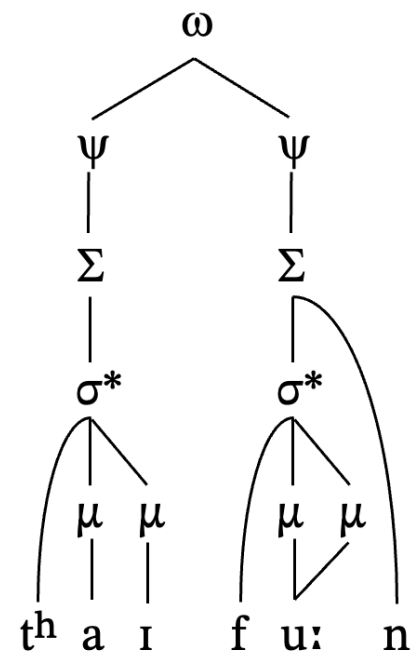

ty·coon /tai'ku:n/ *noun* **1** a business magnate. **2** *hist.* a title applied by foreigners to the shogun of Japan 1854–68. □ **ty·coon·ery** *noun* [Japanese *taikun* great lord, from Chinese *dà* great + *jūn* prince]

In spite of its stress/accent clash, the prosodic stem of *typhoidal* is preserved (cf. *typhoid*), so Canadian Raising applies normally.

The stress/accent clash in *typhoon* and *tycoon* is resolved by pseudocompounding, which blocks Canadian Raising.

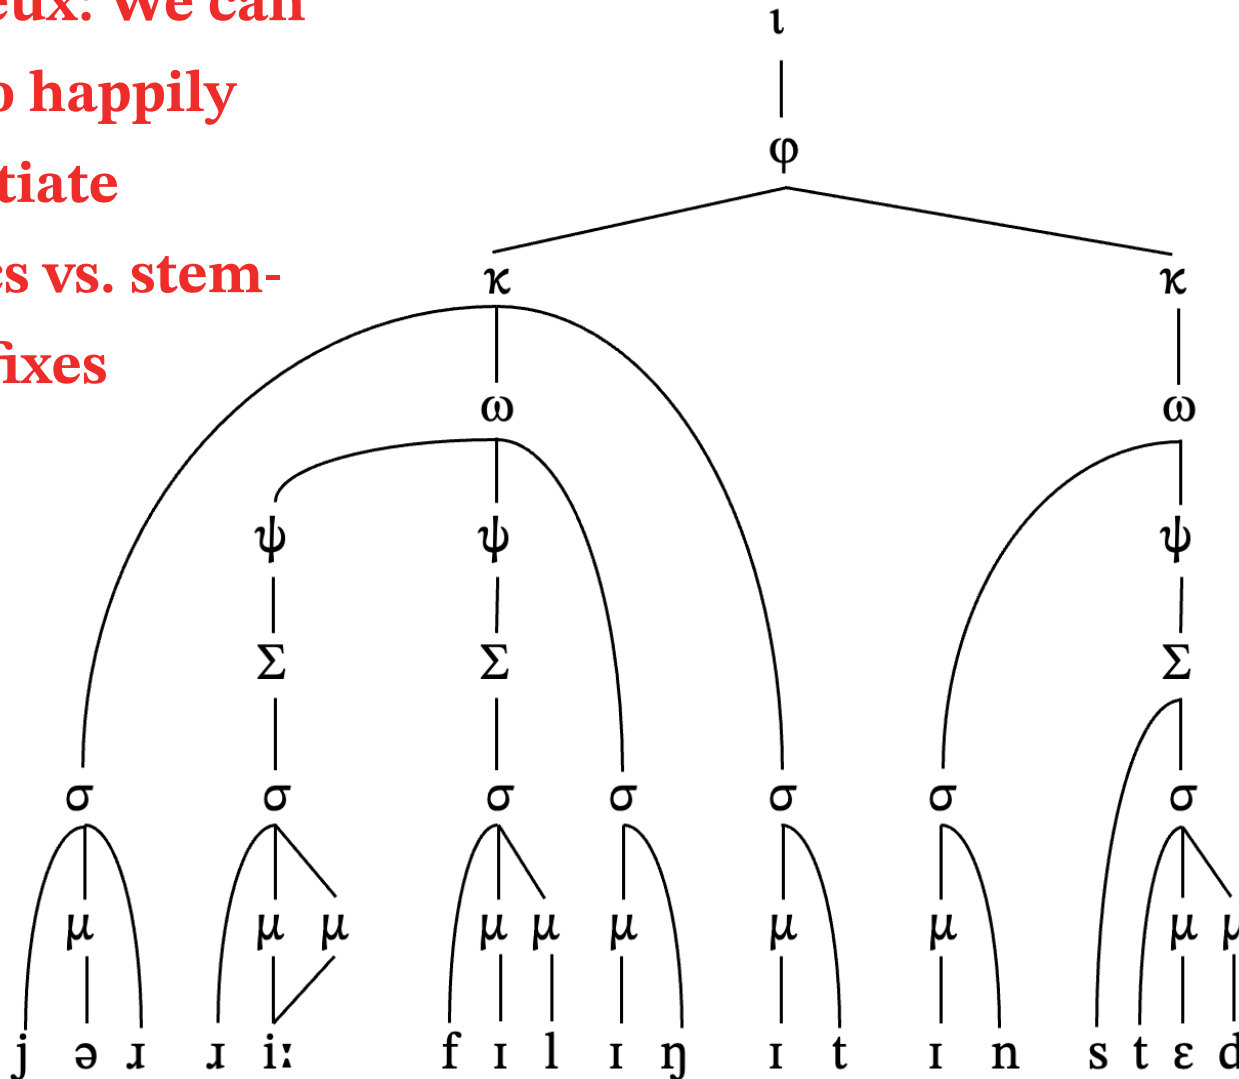

typhoidal

typhoon

**Envoi deux: We can
now also happily
differentiate
proclitics vs. stem-
like prefixes**

You're refilling it instead?
